DETAILED ACTION

1. Claims 1-17 were canceled and claims 18-34 were added.

Claim Objections

2. Claim 18, line 1, and claim 34, line 4; "control" should be changed to "controller".
Claim 19, line 1, "comprising" should be changed to "wherein the" and in line 2 "including" should be changed to "includes".

Claim 20, line 2, delete "application specific circumstances such as" as it appears unnecessarily in the claim and does not serve to further limit or distinguish the claim over the prior art. Furthermore, "the manufacturer-specific" lacks proper antecedent basis.

Claim 29, lines 4-5 are confusing and should be reworded to more accurately reflect what exactly is being claimed.

Allowable Subject Matter

3. Claims 18-34 are allowed.

As per claims 18-34, specifically independent claims 18 and 34, the prior art of record fails to teach or adequately suggest an electronic apparatus comprising at least three specific engines inside the apparatus, one being utilized for controlling the apparatus, one being utilized for device specific definitions and the other being utilized for a universal device definitions, or device independent definitions, wherein the universal definition engine automatically generates the device specific definition engine, in combination with the other claimed features and or limitations as claimed by the claimed invention.

The closest available art was issued to Jones, U.S. Patent No. 6,560,235, on May 6, 2003, in which an automation device (controller) is disclosed that utilizes a communications module that allows for any number of different communication protocols to be used in conjunction with the automation device. The system disclosed by Jones, however, does not teach the automatic generation of a device specific engine

(e.g. program, file, application, code or routine) since each specific engine must be replaced (C4 L55-58) when a different type of network is to be utilized, not automatically generated, as called for by the instant claimed invention.

This difference, in combination with the other claimed features and or limitations forms the basis for the allowance of the aforementioned claims and this distinguishing feature also conveniently provides a means by which the controller may automatically adapt to changes in the network without requiring a user to physically change the communication module, as called for by Jones. This creates a system with increased flexibility and extendibility without the need for user intervention, a desired feature among control systems that utilize "intelligent" or "smart" field devices.

Conclusion

4. This application is in condition for allowance except for the following formal matters as described above in the section labeled "Claim Objections".

Prosecution on the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

A shortened statutory period for reply to this action is set to expire **TWO MONTHS** from the mailing date of this letter.
